

Do you have a parent, sibling or child with MS?

The University of Colorado is conducting a study that will try to improve our understanding of the very earliest signs of Multiple Sclerosis (MS) by looking at individuals at high risk of developing MS, especially young adults with relatives already diagnosed with MS.

You may be eligible to participate if you:

- » Are 18-30 years of age
- » Have a parent, sibling or child with Multiple Sclerosis
- » Have not been diagnosed with MS and have no symptoms concerning for MS

The visit will take place on the University of Colorado Anschutz Medical Campus. Eligible participants will receive a brief brain MRI without contrast.
